

# San Luis Water

STATE SOCIETY

San Luis Water manages the province's water resources, which are the environmental heritage of all San Luis people.

We deal with the integrated management and administration of the provincial raw water and water infrastructure such as dams, aqueducts, canals, public wells and boreholes.

In San Luis Water, we work based on the premise of ensuring quality service in the distribution of raw surface water and groundwater, -promoting in addition a new water usage culture that revolves around awareness and education. Also, with the help of the water police, we inspect and grant allotments of ships sailing our dams; we record our users water consumption, and control connections in order to continue improving production levels in the province.

## AQUEDUCTS and CANALS

### Efficiency and scope of the raw water system.

The aqueducts and canals network currently reach 4,731 km in length, stretching across the provincial map. This system allows to cover 80% of the province with an area of influence of 2,500,000 hectares, which turns the province into a land with high rates of productivity.

San Luis with essential sections as Nogolí aqueduct of 680km, and Eloy Bona aqueduct of 637 Km, being some of the most extensive sections.

Water planning for the coming years includes coverage of 100% of the territory of San Luis with the construction of new trunk raw water pipelines.

Our current network of canals consists of 21 distribution systems that supply more than 1,100 irrigation users in the entire province.

Coated and uncoated canals, among which are Paso de las Carretas, San Felipe, Quines-Candelaria and Renca-Santa Rosa, constitute an efficient system that allocates its waters to the irrigation and production of a province that maintains its development rates on constant rise.
