

# San Luis Water

STATE SOCIETY

San Luis Water manages the province's water resources, which are the environmental heritage of all San Luis people.

We deal with the integrated management and administration of the provincial raw water and water infrastructure such as dams, aqueducts, canals, public wells and boreholes.

In San Luis Water, we work based on the premise of ensuring quality service in the distribution of raw surface water and groundwater, -promoting in addition a new water usage culture that revolves around awareness and education. Also, with the help of the water police, we inspect and grant allotments of ships sailing our dams; we record our users water consumption, and control connections in order to continue improving production levels in the province.

## Water: Strategic Planning

Water is the axis of sustainable development; its availability depends on the sustainability of the current growth →and the future possibilities for San Luis people.

San Luis has few natural water reserves, depending mainly on rainfall to increase the wellbeing and the agricultural, energy and industrial potential →of the province.

For over more than 30 years, the provincial government has implemented a set of water policies that set a real Water Revolution →in motion, through a series of works for the smart storage→ and distribution of the water resource.

San Luis model, applied to the smart water management, has a daily effect of greater social, productive, tourist, economic and cultural development, by conceiving water as the guiding framework of all activities.

## Dams: a unique policy in the country

Over more than three decades, we have been working in the construction of great water storage and distribution works.

Currently the province of San Luis has a total of 20 dams that constitute a reservoir system that responds to a strategic planning applied to the whole map of the province.

This raw water storage system ensures water availability for future generations→. Today, San Luis is the Argentinean province with the largest number of reservoirs in the country.

The 20 dams make San Luis to exceed 465 hm<sup>3</sup> of water stored.
